SUMMARY

AI engineer with hands on experience building and running evaluation pipelines for machine learning outputs across text, speech, and vision data. At TensorGo I designed the quality process that decides whether a model update ships, running structured A/B tests on held out data, tracking error patterns, and writing up findings for the team. Fluent in Hindi and English, and comfortable working across multiple data types and task categories with close attention to detail.

WORK EXPERIENCE

AI and Computer Vision Engineer, TensorGo

April 2026 - Present

Early stage AI startup building enterprise computer vision and generative AI products, Hyderabad, India

- Built an evaluation framework for LLM outputs after production models started hallucinating on domain specific tasks. Ran structured tests across 40+ prompt configurations on held out datasets, tracked error patterns by category, and identified the fix that lifted task accuracy from 76% to 91% and cut the hallucination rate by 28%. This process now reviews and gates every model update before it reaches production.
- Evaluated 12 vision architectures (ViT, DETR, YOLOv9, SAM) on our own hardware, scoring each against accuracy, throughput, and memory use, then wrote up the comparison and presented it to the team. The model we picked ended up 15% more accurate at the same compute budget.
- Wired together a voice pipeline covering speech, audio, and language data end to end: Whisper and Google Chirp 3 for speech to text, GPT-4 and Claude for reasoning, ElevenLabs and F5 Indic for text to speech, with async orchestration keeping the full round trip under 800ms.
- Migrated a production inference service from PyTorch to ONNX with INT8 quantization and added Redis caching, cutting latency 35% at peak load with under 0.5% accuracy loss.
- Trained a PointNet LiDAR model for road boundary detection and deployed it on an NVIDIA Jetson AGX, reaching 92% mIoU at 30 FPS after iterative on device testing and compression, 22 points above the previous SVM baseline.

PROJECTS

HumAI Pulse, Automated QA and Evaluation Agent | Python, LangGraph, Evidence Gated Verification | 2026

- Built an autonomous QA agent that generates and grades test cases against an evidence gated oracle instead of trusting a model's own confidence, catching failure modes that manual spot checks missed.

CapForge, Authorization SDK for AI Agents | Python, Ed25519, Pydantic V2, LangGraph, FastAPI | Jul 2026

- Designed a signed authorization document format (Agent Capability Manifest) so an AI agent can declare and prove what it is allowed to do. Published to PyPI (v0.5.0) with 100 tests and CI. github.com/shashank123r/capforge · pypi.org/project/capforge

GeoSentinel, Satellite Disaster Monitoring | Python, TensorFlow, Siamese U-Net | IEEE ICDCA 2026, Paper ID 557

- Trained a change detection pipeline on 19,000+ satellite image pairs across 6 disaster types, reaching 88% precision and 94.7% accuracy. Manually reviewed model outputs against ground truth labels to catch classification errors before publishing results at IEEE ICDCA 2026.

TECHNICAL SKILLS

Languages spoken: English (fluent), Hindi (fluent), Telugu (native)

Data and evaluation: dataset curation, error analysis, A/B testing, annotation quality review, held out test set design, dialogue and prompt evaluation

ML and CV: PyTorch, TensorFlow, OpenCV, Hugging Face, YOLO, PointNet, ONNX, fine-tuning, Scikit-learn

LLM and speech/audio: GPT-4, Claude, LLaMA 3.1, Whisper, ElevenLabs, Sarvam AI, LangChain, prompt engineering

Tools: Python, SQL, FastAPI, PostgreSQL, Docker, Microsoft Office, GitHub Actions, Linux

EDUCATION

B.Tech in Artificial Intelligence and Data Science, REVA University, Bengaluru Aug 2022 - Expected Nov 2026

CGPA: 8.87 / 10.0

AWARDS AND RECOGNITION

- IEEE ICDCA 2026, paper accepted and presented: Siamese U-Net for Satellite Based Natural Disaster Analysis (Paper ID 557).
- Top 5 of 56 Teams, Cepheus 2025 National Hackathon, 24 hour Healthcare track, Bengaluru.
